Last question's link doesn't work, you can find documentation here

<https://docs.microsoft.com/en-us/azure/cloud-adoption-framework/decision-guides/regions/>

"Azure resource groups are regional specific constructs. It is normal, however, for resources within a resource group to span multiple regions. When doing so, it is important to consider that in the event of a regional failure, control plane operations against a resource group will fail in the affected region, even though the resources in other regions (within that resource group) will continue to operate. This can affect both your network design and your resource group design."

No: A resource can connect to resources in other resource groups. This scenario is common when the two resources are related but don't share the same lifecycle. For example, you can have a web app that connects to a database in a different resource group.

Yes: When you delete a resource group, all resources in the resource group are also deleted.

Yes: The resources in a resource group can be located in different regions than the resource group.

When you create a resource group, you need to provide a location for that resource group.

The answered is correct

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/management/overview#resource-groups>

- The resources in a resource group can be located in different regions than the resource group.
- The resource group stores metadata about the resources. When you specify a location for the resource group, you're specifying where that metadata is stored. For compliance reasons, you may need to ensure that your data is stored in a particular region.
