Azure Monitor is correct answer.

Azure Service Health provides the health/status of Azure service.

Azure Monitor - Provides Health/Status of your application using insights and logs

Impact due to act on Azure end- Servic eHealth

Impact due to act on Your end (including both on prem +Azure resource) - Azure Monitor (As it can asses your log & telemetry)

Hence answer here is Monitor

C. Azure Monitor

Azure Monitor can be used to automatically send an alert if an administrator stops an Azure virtual machine. With Azure Monitor, you can set up alerts based on metrics and log data, and you can receive notifications through email, SMS, webhooks, and other channels.

In the case of an Azure virtual machine, you can use Azure Monitor to set up an alert that triggers if the virtual machine goes down or becomes unavailable. This way, you can receive an alert as soon as the virtual machine stops, allowing you to take prompt action and resolve the issue.

Azure Advisor provides recommendations for optimizing your Azure resources. Azure Service Health provides information about the health of Azure services and helps you prepare for, and respond to, Azure service incidents. Azure Network Watcher provides monitoring and diagnostics for your Azure network.
