EXAM AZ-900 TOPIC 1 QUESTION 173 DISCUSSION

Actual exam question from Microsoft's AZ-900

Question #: 173

Topic #: 1

[\[All AZ-900 Questions\]](#)

You have an on-premises application that sends email notifications automatically based on a rule.

You plan to migrate the application to Azure.

You need to recommend a serverless computing solution for the application.

What should you include in the recommendation?

- A. a web app
- B. a server image in Azure Marketplace
- C. a logic app
- D. an API app

haha logic app is the only one I didn't know anything about, but seeing the 3 options I knew none of them are suitable for this. So I ended guessing this right :)

B - it's a server, you need a serverless solution

D - API, no! you need to migrate the whole app

A - web app, no, NO because web requires a server. The web is nothing but a huge WAN composed of many, many LANs.

C - Whereas logic apps at least tells no conflicting information and implies you can migrate the whole app to it. Also the word "logic" refers to the email app sending emails "based on one rule". So I imagine it is done automatically, or 'logically'. Hence they are requiring a ServerLESS solution!

Answer : C

Explanation:

Azure Logic Apps is a cloud service that helps you schedule, automate, and orchestrate tasks, business processes, and workflows when you need to integrate apps, data, systems, and services across enterprises or organizations. Logic Apps simplifies how you design and build scalable solutions for app integration, data integration, system integration, enterprise application integration (EAI), and business-to-business (B2B) communication, whether in the cloud, on premises, or both. For example, here are just a few workloads you can automate with logic apps:

-> Process and route orders across on-premises systems and cloud services.

-> Send email notifications with Office 365 when events happen in various systems, apps, and services.

-> Move uploaded files from an SFTP or FTP server to Azure Storage.

-> Monitor tweets for a specific subject, analyze the sentiment, and create alerts or tasks for items that need review.

honestlt am somehow confused. In reality if i will deploy a new app in Logic App i should refactor my app... but if i should find a solution without refactoring maybe an API should be enough
