Single sign-on (SSO) enables a user to sign in one time and use that credential to access multiple resources and applications from different providers. For SSO to work, the different applications and providers must trust the initial authenticator.

Multifactor authentication is the process of prompting a user for an extra form (or factor) of identification during the sign-in process. MFA helps protect against a password compromise in situations where the password was compromised but the second factor wasn't.

Answer:

Single sign-on (SSO) >> The ability to use the same credentials to access multiple resources and applications from different providers

Authentication >> The process of identifying the access level of a user or service

Multi-factor authentication(MFA) - Requires several elements to identify a user or a service
