I thought it was storage since the container's job is to store customers' data.
after looking it up it states that containers can be used to store data within a container image or container volume, the primary purpose of containers is to provide a standardized way to package and deploy applications. Therefore, Azure Container Instances and Azure Kubernetes Service have computed services rather than storage services.

Indeed, containers are primarily used to deploy and run applications. They can be used for storage as well, but Azure offers other solutions more tailored for that purpose.
