HOTSPOT -

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer Area

Statements

Yes

No

Network security groups (NSGs) can contain multiple inbound and outbound security rules.

☐☐

A VM that performs a particular function such as running a firewall is also called a Network virtual appliance.

☐☐

A user-defined route (UDR) can only control network traffic between subnets of a single virtual network.

☐☐

Third is NO. You can configure UDRs between two subnets in different virtual networks.

Is Y,Y,N

The statement "A user-defined route (UDR) can only control network traffic between subnets of a single virtual network" is incorrect.

In Azure, user-defined routes (UDRs) can indeed control network traffic within a single virtual network, but they can also influence traffic to destinations outside of the virtual network. This includes routing traffic to on-premises networks through VPN gateways, peered virtual networks, or even the internet via a Network Virtual Appliance (NVA).

3 - keyword is only - so its No

A User Defined Route (UDR) in Azure can control network traffic not only within a single Virtual Network (VNet) but also between different subnets, VNets (through VNet peering), and even to on-premises networks if connected via VPN or ExpressRoute. UDRs provide a way to define how traffic is routed in the network, offering flexibility beyond the default system routes Azure provides.
