"network security group" is the answer.

<https://learn.microsoft.com/en-us/azure/virtual-network/network-security-groups-overview>

You can use an Azure network security group to filter network traffic between Azure resources in an Azure virtual network. A network security group contains security rules that allow or deny inbound network traffic to, or outbound network traffic from, several types of Azure resources. For each rule, you can specify source and destination, port, and protocol.
