  **d33f59e** 2 months, 4 weeks ago

Reliability is the ability of a system to recover from failures and continue to function. It's also one of the pillars of the Microsoft Azure Well-Architected Framework.

Availability refers to system uptime, or when the system is available to users/other applications. High Availability simply means that system is designed to run for a very long period of time. So in the context of this question, if a service failure were to happen you can give cloud resources via high availability to prevent mission critical applications from failing.
