EXAM AZ-900 TOPIC 1 QUESTION 411 DISCUSSION

Actual exam question from Microsoft's AZ-900

Question #: 411

Topic #: 1

[\[All AZ-900 Questions\]](#)

You plan to reduce ongoing Azure expenditures.

You need to identify which factors affect the costs of a resource.

Which three factors should you identify? Each correct answer presents a complete solution.

NOTE: Each correct selection is worth one point.

- A. the volume of outbound data
- B. the volume of inbound data
- C. the service tier
- D. the Azure region
- E. the type of processed data

Should be A C D

Region matters. Definitely not the type of data

upvoted 3 times

DimsumDestroyer 1 year, 2 months ago

ACD. Data is just data, which can all be measured in bits. Microsoft wouldn't and shouldn't care.

Selected Answer: ACD

ACD. The type of the processed data is none of Microsoft's business, as it's ours.

ClaGar 1 year, 5 months ago

ACD. A and C, no doubt. D since as per others previous questions region has something to do with paying more (cheaper within lower cost-of-life regions)

upvoted 1 times

ClaGar 1 year, 5 months ago

Type od data might be a factor, though. Vectorial or geospatial data types might be costly to store and mange than plain ones.

There are several factors that can affect the costs of a resource in Azure. Here are three factors that you should consider when trying to identify which factors are affecting the costs of a resource:

The volume of outbound data: The volume of data that is transferred out of Azure can affect the costs of a resource. For example, if you have a resource that generates a large volume of outbound data, such as a web server that serves a lot of content to users, this can result in higher costs.

The service tier: The service tier that you choose for a resource can also affect its costs. For example, if you choose a higher service tier, such as a more powerful virtual machine, this can result in higher costs.

The Azure region: The Azure region in which a resource is deployed can also affect its costs. Azure regions are geographical areas that contain one or more data centers, and the costs of resources can vary depending on the region in which they are deployed.
