Lol I love questions that basically ask you to pick a fruit, options are orange and apple.

Without NAT you cannot convert private IP to public IP.

Without a network rule to enable traffic, all traffic is implicitly denied, so you need to create an allow rule to communicate with your server.

Love the analogy. But yeah, it's pretty sad.

"NAT rules" is the answer.

<https://learn.microsoft.com/en-us/azure/firewall/policy-rule-sets#dnat-rules>

DNAT rules allow or deny inbound traffic through the firewall public IP address(es). You can use a DNAT rule when you want a public IP address to be translated into a private IP address. The Azure Firewall public IP addresses can be used to listen to inbound traffic from the Internet, filter the traffic and translate this traffic to internal resources in Azure.
