## **EXAM AZ-900 TOPIC 1 QUESTION 405 DISCUSSION**

Actual exam question from Microsoft's AZ-900

Question #: 405

Topic #: 1

[All AZ-900 Questions]

You plan to collect and analyze event details for five Azure virtual machines.

You need to run queries to compare the event details collected from all the virtual machines.

Which two tools should you use? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Azure Service Health
- **B. Azure Service Bus**
- C. Azure Monitor
- D. Azure Advisor
- E. Log Analytics

**Show Suggested Answer**

#### Selected Answer: CE

C. Azure Monitor

E. Log Analytics

Azure Monitor is a comprehensive monitoring solution for Azure services that includes several monitoring tools and services. It provides a unified view of all your Azure resources, including virtual machines, and enables you to collect, analyze, and act on telemetry data from those resources.

Log Analytics is a tool within Azure Monitor that enables you to collect and analyze log data from your virtual machines and other Azure resources. You can use Log Analytics to run queries and create visualizations based on the log data, and to set up alerts and notifications based on specific events or conditions.

#### Selected Answer: CE

CE is the answer.

https://learn.microsoft.com/en-us/azure/azure-monitor/logs/log-query-overview

Log Analytics: Use this primary tool in the Azure portal to edit log queries and interactively analyze their results. Even if you intend to use a log query elsewhere in Azure Monitor, you'll typically write and test it in Log Analytics before you copy it to its final location.

https://learn.microsoft.com/en-us/training/modules/describe-monitoring-tools-azure/4-describe-azure-monitor Azure Log Analytics is the tool in the Azure portal where you'll write and run log queries on the data gathered by Azure Monitor. Log Analytics is a robust tool that supports both simple, complex queries, and data analysis. You can write a simple query that returns a set of records and then use features of Log Analytics to sort, filter, and analyze the records. You can write an advanced query to perform statistical analysis and visualize the results in a chart to identify a particular trend. Whether you work with the results of your queries interactively or use them with other Azure Monitor features such as log query alerts or workbooks, Log Analytics is the tool that you're going to use to write and test those queries.

Azure Monitor is a service that provides a central location for monitoring Azure resources. It allows you to collect, analyze, and act on telemetry data from Azure resources, including virtual machines. It allows you to collect data from various sources like Virtual Machines, SQL databases, App services, and others.

Log Analytics is a feature of Azure Monitor that allows you to collect, search, and analyze log data from Azure resources. It allows you to run queries to compare the event details collected from all the virtual machines, which is what you need to do in this scenario, to perform a comparison on event details.

https://learn.microsoft.com/en-us/training/modules/describe-monitoring-tools-azure/4-describe-azure-monitor Azure Monitor is a platform for collecting data on your resources, analyzing that data, visualizing the information, and even acting on the results. Azure Monitor can monitor Azure resources, your on-premises resources, and even multi-cloud resources like virtual machines hosted with a different cloud provider.
