The correct answer is B. Azure Service Health.

Azure Service Health is a feature in Azure that helps you stay informed about the availability of the Azure services that you are using, and provides guidance when planned and unplanned maintenance events may affect those services. You can use Azure Service Health to get notifications about planned maintenance events that may affect your resources, as well as to view the current and past health status of the Azure services in your subscription.

By using Azure Service Health, you can proactively plan for maintenance events and take appropriate action to minimize any potential impact on your resources and workloads.
